Exam : **70-561C++**

Title : TS: MS .NET Framework
3.5, ADO.NET Application
Development

Version : Demo

1. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

You need to ensure that the application can connect to any type of database.

What should you do?

A. Set the database driver name in the connection string of the application, and then create the connection object in the following manner.

```
DbConnection connection = new OdbcConnection(connectionString);
```

B. Set the database provider name in the connection string of the application, and then create the connection object in the following manner.

```
DbConnection connection = new OleDbConnection(connectionString);
```

C. Create the connection object in the following manner.

```
DbProviderFactory factory =
```

```
    DbProviderFactories.GetFactory("System.Data.Odbc");
```

```
DbConnection connection = factory.CreateConnection();
```

D. Create the connection object in the following manner.

```
DbProviderFactory factory =
```

```
    DbProviderFactories.GetFactory(databaseProviderName);
```

```
DbConnection connection = factory.CreateConnection();
```

Answer: D

2. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

The application throws an exception when the SQL Connection object is used.

You need to handle the exception.

Which code segment should you use?

A. try

```
{  
    if(null!=conn)  
        conn.Close();  
    // code for the query  
}
```

```
catch (Exception ex)
```

```
{
```

```
    // handle exception
```

```
}
```

```
finally
```

```
{
```

```
    if(null==conn)
```

```
        conn.Open();
```

```
}
```

```
B. try
```

```
{
```

```
    conn.Close();
```

```
    // code for the query
```

```
}
```

```
catch (Exception ex)
```

```
{
```

```
    // handle exception
```

```
}
```

```
finally
```

```
{
```

```
    if(null!=conn)
```

```
        conn.Open();
```

```
}
```

```
C. try
```

```
{
```

```
    conn.Open();
```

```
    // code for the query
```

```
}
```

```
catch (Exception ex)
```

```
{
```

```
    // handle exception
```

```
}
```

```
finally
```

```
{
```

```
    if(null!=conn)
```

```
        conn.Close();
```

```
}
```

```
D. try
```

```
{
```

```
    conn.Open();
```

```
    // code for the query
```

```
}
```

```
catch (Exception ex)
```

```
{
```

```
    // handle exception
```

```
}
```

```
finally
```

```
{
```

```
    if(null==conn)
```

```
        conn.Close();
```

```
}
```

Answer: C

3. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You need to separate the security-related exceptions from the other exceptions for database operations at run time.

Which code segment should you use?

A. catch (System.Security.SecurityException ex)

```
{
```

```
//Handle all database security related exceptions.  
}  
B. catch (System.Data.SqlClient.SqlException ex)  
{  
    for (int i = 0; i < ex.Errors.Count; i++){  
        if (ex.Errors[i].Class.ToString() == "14") {  
            //Handle all database security related exceptions.  
        }  
        else{  
            //Handle other exceptions  
        }  
    }  
}
```

```
C. catch (System.Data.SqlClient.SqlException ex)  
{  
    for (int i = 0; i < ex.Errors.Count; i++){  
        if (ex.Errors[i].Number == 14){  
            //Handle all database security related exceptions.  
        }  
        else{  
            //Handle other exceptions  
        }  
    }  
}
```

```
D. catch (System.Data.SqlClient.SqlException ex)  
{  
    for (int i = 0; i < ex.Errors.Count; i++){  
        if (ex.Errors[i].Message.Contains("Security")){  
            //Handle all database security related exceptions.  
        }  
    }  
}
```

```
else{
    //Handle other exceptions
}
}
```

Answer: B

4. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You write the following code segment.

```
string queryString = "Select Name, Age from dbo.Table_1";
SqlCommand command = new SqlCommand(queryString,
    (SqlConnection)connection));
```

You need to get the value that is contained in the first column of the first row of the result set returned by the query.

Which code segment should you use?

A. `var value = command.ExecuteScalar();`

```
string requiredValue = value.ToString();
```

B. `var value = command.ExecuteNonQuery();`

```
string requiredValue = value.ToString();
```

C. `var value = command.ExecuteReader(CommandBehavior.SingleRow);`

```
string requiredValue = value[0].ToString();
```

D. `var value = command.ExecuteReader(CommandBehavior.SingleRow);`

```
string requiredValue = value[1].ToString();
```

Answer: A

5. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You write the following code segment. (Line numbers are included for reference only.)

```
01 using (SqlConnection connection = new
```

```
SqlConnection(connectionString) {  
02  SqlCommand cmd = new SqlCommand(queryString, connection);  
03  connection.Open();  
04  
05  while (sdrdr.Read()){  
06      // use the data in the reader  
07  }  
08 }
```

You need to ensure that the memory is used efficiently when retrieving BLOBs from the database.

Which code segment should you insert at line 04?

- A. SqlDataReader sdrdr =
cmd.ExecuteReader();
- B. SqlDataReader sdrdr =
cmd.ExecuteReader(CommandBehavior.Default);
- C. SqlDataReader sdrdr =
cmd.ExecuteReader(CommandBehavior.SchemaOnly);
- D. SqlDataReader sdrdr =
cmd.ExecuteReader(CommandBehavior.SequentialAccess);

Answer: D

6. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You write the following code segment.

```
string query = "Select EmpNo, EmpName from dbo.Table_1;  
select Name, Age from dbo.Table_2";  
SqlCommand command = new SqlCommand(query, connection);  
SqlDataReader reader = command.ExecuteReader();
```

You need to ensure that the application reads all the rows returned by the code segment.

Which code segment should you use?

- A. while (reader.NextResult())

```
{  
    Console.WriteLine(String.Format("{0}, {1}",reader[0], reader[1]));  
    reader.Read();  
}
```

B. while (reader.Read())

```
{  
    Console.WriteLine(String.Format("{0}, {1}",reader[0], reader[1]));  
    reader.NextResult();  
}
```

C. while (reader.Read())

```
{  
    Console.WriteLine(String.Format("{0}, {1}",reader[0], reader[1]));  
}
```

reader.NextResult();

while (reader.Read())

```
{  
    Console.WriteLine(String.Format("{0}, {1}",reader[0], reader[1]));  
}
```

D. while (reader.NextResult())

```
{  
    Console.WriteLine(String.Format("{0}, {1}",reader[0], reader[1]));  
}
```

reader.Read();

while (reader.NextResult())

```
{  
    Console.WriteLine(String.Format("{0}, {1}",reader[0], reader[1]));  
}
```

Answer: C

7. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

The application has a DataTable object named OrderDetailTable. The object has the following columns:

- ` ID
- ` OrderID
- ` ProductID
- ` Quantity
- ` LineTotal

The OrderDetailTable object is populated with data provided by a business partner. Some of the records contain a null value in the LineTotal field and 0 in the Quantity field.

You write the following code segment. (Line numbers are included for reference only.)

```
01 DataColumn col = new DataColumn("UnitPrice", typeof(decimal));  
02  
03 OrderDetailTable.Columns.Add(col);
```

You need to add a DataColumn named UnitPrice to the OrderDetailTable object.

Which line of code should you insert at line 02?

- A. col.Expression = "LineTotal/Quantity";
- B. col.Expression = "LineTotal/ISNULL(Quantity, 1)";
- C. col.Expression = "LineTotal.Value/ISNULL(Quantity.Value,1)";
- D. col.Expression = "iif(Quantity > 0, LineTotal/Quantity, 0)";

Answer: D

8. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

The application contains a DataSet object named orderDS. The object contains a table named Order as shown in the following exhibit.

The application uses a SqlDataAdapter object named daOrder to populate the Order table.

You write the following code segment. (Line numbers are included for reference only.)

```
01 private void FillOrderTable(int pageIndex) {
```

```
02 int pageSize = 5;
```

```
03
```

```
04 }
```

You need to fill the Order table with the next set of 5 records for each increase in the pageIndex value.

Which code segment should you insert at line 03?

A. `string sql = "SELECT SalesOrderID, CustomerID, OrderDate FROM Sales.SalesOrderHeader";`

```
daOrder.SelectCommand.CommandText = sql;
```

```
daOrder.Fill(orderDS, pageIndex, pageSize, "Order");
```

B. `int startRecord = (pageIndex - 1) * pageSize;`

```
string sql = "SELECT SalesOrderID, CustomerID, OrderDate FROM Sales.SalesOrderHeader";
```

```
daOrder.SelectCommand.CommandText = sql;
```

```
daOrder.Fill(orderDS, startRecord, pageSize, "Order");
```

C. `string sql = string.Format("SELECT TOP {0} SalesOrderID, customerID,`

```
orderDate FROM Sales.SalesOrderHeader WHERE SalesOrderID > {1}",
```

```
pageSize, pageIndex);
```

```
daOrder.SelectCommand.CommandText = sql;
```

```
daOrder.Fill(orderDS, "Order");
```

D. `int startRecord = (pageIndex - 1) * pageSize;`

```
string sql = string.Format("SELECT TOP {0} SalesOrderID, CustomerID, orderDate FROM Sales.SalesOrderHeader WHERE SalesOrderID > {1}",
```

```
pageSize, startRecord);
```

```
daOrder.SelectCommand.CommandText = sql;
```

```
daOrder.Fill(orderDS, "Order");
```

Answer: B

9. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

The application contains a TextBox control named txtProductID. The application will return a list of active

products that have the ProductID field equal to the txtProductID.Text property.

You write the following code segment. (Line numbers are included for reference only.)

```
01 private DataSet GetProducts(SqlConnection cn) {
02     SqlCommand cmd = new SqlCommand();
03     cmd.Connection = cn;
04     SqlDataAdapter da = new SqlDataAdapter(cmd);
05     DataSet ds = new DataSet();
06
07     da.Fill(ds);
08     return ds;
09 }
```

You need to populate the DataSet object with product records while avoiding possible SQL injection attacks.

Which code segment should you insert at line 06?

A. cmd.CommandText = string.Format("sp_sqlexec 'SELECT ProductID, Name FROM Product WHERE ProductID={0} AND IsActive=1'", txtProductID.Text);

B. cmd.CommandText = string.Format("SELECT ProductID, Name FROM Product WHERE ProductID={0} AND IsActive=1", txtProductID.Text);

cmd.Prepare();

C. cmd.CommandText = string.Format("SELECT ProductID, Name FROM Product WHERE ProductID={0} AND IsActive=1", txtProductID.Text);

cmd.CommandType = CommandType.TableDirect;

D. cmd.CommandText = "SELECT ProductID, Name FROM Product WHERE ProductID=@productID AND IsActive=1";

cmd.Parameters.AddWithValue("@productID", txtProductID.Text);

Answer: D

10. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

The application analyzes large amounts of transaction data that are stored in a different database.

You write the following code segment. (Line numbers are included for reference only.)

```
01 using (SqlConnection connection = new
    SqlConnection(sourceConnectionString))
02 using (SqlConnection connection2 = new
    SqlConnection(destinationConnectionString))
03 using (SqlCommand command = new SqlCommand())
04 {
05     connection.Open();
06     connection2.Open();
07     using (SqlDataReader reader = command.ExecuteReader())
08     {
09         using (SqlBulkCopy bulkCopy = new
            SqlBulkCopy(connection2))
10         {
11
12         }
13     }
14 }
```

You need to copy the transaction data to the database of the application.

Which code segment should you insert at line 11?

A. reader.Read()

bulkCopy.WriteToServer(reader);

B. bulkCopy.DestinationTableName = "Transactions";

bulkCopy.WriteToServer(reader);

C. bulkCopy.DestinationTableName = "Transactions";

bulkCopy.SqlRowsCopied += new

SqlRowsCopiedEventHandler(bulkCopy_SqlRowsCopied);

D. while (reader.Read())

{

bulkCopy.WriteToServer(reader);

}

Answer: B
